

Secure LC Extended Extraction Tool

Advanced Fiber Products Ltd. (AFP) is a leading designer, developer and manufacturer of optical and optoelectronic products for telecom, enterprise, oil and gas, video broadcast and military markets. AFP offers a wide range of novel components, custom optical sub-assemblies and also complete media conversion and data transmission solutions. It provides competitive products and excellent service all over the world. AFP's facilities are located at Haverhill, near Cambridge in the United Kingdom and in Chicago, USA.

AFP's unique Secure LC connectors are designed to prevent unauthorized and inadvertent changes in highly sensitive applications, such as Datacenters and Secure IT networks where multiple physical layer classifications may exist. (Secure LC Patent applied).

The Extended Keyed Extraction tool is a clip-on accessory for all the SLC standard extraction tools that allows accurate and easy 'remote extraction' of connectors in deep high density and access restricted patching environments. Reverse the tool, and it operates as an extended 'insertion' tool.

Without the use of the extension tool, operators may not be able to remove connectors or port plugs from adaptors without adversely affecting the existing cabling network or cable management hardware. Or worse still, disturb and damage cabling in the patching vicinity.

All the AFP SLC keyed extraction tools automatically de-latch the connectors without finger stress/pressure or the use of mechanical pliers. The tool comes equipped with a retained custom dust cap required to remove the tool from the connector body.

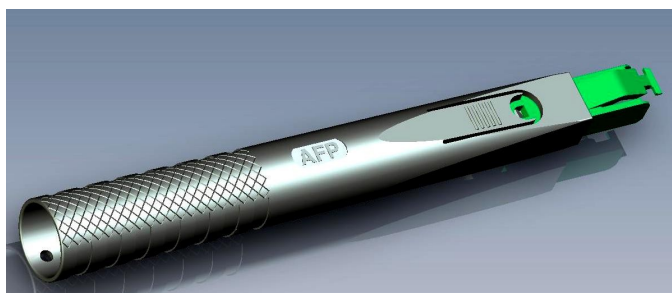

Part Number : T0010121-XT

Applications

- To secure the connectivity on the 'inside' of enclosures
- Highest density patching where manual plugging and extraction is impossible

Features

- 8 key combinations with separate colors
- "Administrator key" option
- Clips on and off standard SLC Keyed Extraction Tools

Secure LC Patent Application No.0903326.7
